

Technical Information

Solicap M FTI55, FTI56

Capacitance Point level switch for bulk solids

Application

Solicap M is used for point level detection in bulk solids and can be operated in minimum or maximum fail-safe mode.

Due to its robust construction, it can also be used to provide accurate measurements in applications with very high tensile loads (up to 60 kN for rope version) or lateral loads (up to 300 Nm for rod version).

In combination with Fieldgate (for remote interrogation of measured values using internet technology), Solicap M represents an ideal solution for material provisioning and logistical optimization (inventory control).

Your benefits

- Extremely robust design for harsh process conditions
- Easy and fast commissioning as calibration is performed at the press of a button
- Universal application thanks to wide range of certificates and approvals
- Two-stage overvoltage protection against static discharges from the silo
- Active buildup compensation for bulk solids that tend to cake
- Use in safety systems with specific requirements in terms of functional safety to SIL2/SIL3 in conjunction with electronic insert FEI55
- Increased safety due to permanent automatic monitoring of electronics
- Reduction in storage costs thanks to easy-to-shorten rod model (for partial insulation) and rope model (for partial and full insulation)
- Two-point control (e.g. for controlling a handling device)

Function and system design

Measuring principle

The principle of capacitance point level detection is based on the change in capacitance of a capacitor as a result of the probe being covered by bulk solids. The probe and container wall (conductive material) form an electric capacitor. When the probe is in air (1), a certain low initial capacitance is measured. If the container is being filled, the capacitance of the capacitor increases as more of the probe is covered (2), (3).

The point level switch switches when the capacitance C_S specified during calibration is reached. In addition, a probe with inactive length ensures that the effects of medium buildup or condensate near the process connection are avoided. A probe with active buildup compensation compensates for the effects of buildup on the probe in the area of the process connection.

R: Conductivity of bulk solids C: Capacitance of bulk solids C_A : Initial capacitance (probe not covered) C_S : Switching capacitance ΔC : Change in capacitance

Function

The electronic insert selected for the probe determines the change in capacitance depending on how much of the probe is covered. This ensures accurate switching at the switchpoint (level) calibrated for this purpose.

Application examples

Sand, glass aggregate, gravel, molding sand, lime, ore (crushed), plaster, aluminum shavings, cement, grain, pumice, flour, dolomite, sugar beet, kaolin, fodder and similar bulk solids.

In general: Bulk solids with a relative dielectric constant $\epsilon_{\rm r} \geq 2.5.$

Measuring system

The make-up of the measuring system depends on the electronic insert selected.

Point level switch

The complete measuring system consists of:

- $\hfill \hfill \hfill$
- An electronic insert FEI51, FEI52, FEI54

Two-point control (As function)

Note! Partially insulated probes only in conjunction with nonconductive bulk solids.

The point level switch can also be used to control a screw conveyor, for example, where the on and off values can be freely defined.

Point level switch

Solicap M FTI5x with electronic versions FEI53, FEI57S and FEI58 for connecting to a separate switching unit.

The complete measuring system consists of:

- the capacitance point level switch, Solicap M FTI55 or FTI56
- an electronic insert FEI53, FEI57S, FEI58
- a transmitter power supply unit e.g. FTC325, FTC625 (SW V1.4 or higher), FTC470Z, FTC471Z, FTL325N, FTL375N

* Only possible with FEI53

The following table shows the transmitter power supply units available which can be operated with electronic inserts FEI57S and FEI53.

Electronic insert	FEI57S	FEI53	FEI58
Transmitter power supply unit			
FTC625	Х	_	_
FTC325	Х	Х	_
FTL325N	_	-	Х
FTL375N	_	_	Х
FTC470Z	Х	_	_
FTC471Z	Х	-	-
FTC520Z*	Х	_	-
FTC521Z*	Х	_	_
FTC420*	_	Х	_
FTC421*	_	Х	_
FTC422*	-	Х	_

x Combination is possible

– Combination is not possible

* Product phase-out 2006

Point level switch 8/16 mA

The complete measuring system consists of:

- the point level switch, Solicap M FTI55 or FTI56
- the FEI55 electronic insert
- a transmitter power supply unit (e.g. RN221N, RNS221, RMA421, RMA422)

Electronic versions

FEI51

Two-wire AC connection

- Load switched directly into the power supply circuit via the thyristor.
- Point level adjustment directly at the point level switch.

FEI52

3-wire direct current version:

- Switch the load via the transistor (PNP) and separate supply voltage connection.
- Point level adjustment directly at the point level switch.

FEI53

3-wire direct current version with 3 to 12 V signal output:

- For separate switching unit, Nivotester FTC325 3–WIRE.
- Point level adjustment directly at the switching unit.

FEI54

Universal current version with relay output:

- Switch the loads via 2 floating changeover contacts (DPDT).
- Point level adjustment directly at the point level switch.

FEI55

Signal transmission 8/16 mA on two-wire cabling:

- SIL2 approval for the hardware
- SIL3 approval for the software
- For separate switching unit (e.g. RN221N, RNS221, RMA421, RMA422).
- Point level adjustment directly at the point level switch.

FEI57S

PFM signal transmission (current pulses are superimposed on the supply current):

 For separate switching unit with PFM signal transmission e.g. FTC325 PFM, FTC625 PFM and FTC470Z/471Z

- Self-test from the switching unit without changing levels.
- Point level adjustment directly at the point level switch.
- Cyclical checking from the switching unit.

FEI58 (NAMUR)

Note!

Signal transmission H-L edge 2.2 to 3.5 / 0.6 to 1.0 mA as per IEC 60947-5-6 on two-wire cable:

- For a separate switching unit (e.g. Nivotester FTL325N and FTL375N).
- Point level adjustment directly at the point level switch.
- Test the connection cables and slaves by pressing the button on the electronic insert.

For additional information see \rightarrow \ge 31 ff.

System integration via Fieldgate

Vendor managed inventory

The remote interrogation of tank or silo levels via Fieldgate enables suppliers of raw materials to gather information about the current inventories of their regular customers at any time and, for example, to take this into account in their own production planning. The Fieldgate monitors the configured point levels and automatically triggers the next order as required. Here, the range of possibilities ranges from simple requisitioning by e-mail through to fully automatic order processing by incorporating XML data into the planning systems on both sides.

Remote maintenance of measuring systems

Not only does Fieldgate transmit the current measured values, it also alerts the standby personnel responsible by e-mail or SMS as required. Fieldgate forwards the information transparently. In this way, all options of the operating software in question are available remotely. By using remote diagnosis and remote configuration some onsite service operations can be avoided and all others can at least be planned and prepared better.

Operating conditions: Installation

Note! All dimensions in mm.

General notes

Filling the silo The filling stream should not be directed onto the probe.

Angle of material flow

Note the expected angle of the material flow or of the outlet funnel when determining the mounting location or probe length.

Distance between probes

When installing several probes in a silo, a minimum distance of 0.5 m between the probes must be observed.

Threaded coupling for mounting

When installing the Solicap M FTI55, FTI56, the threaded coupling should be as short as possible.

Condensation or product residue may occur in a long threaded coupling and interfere with the correct operation of the probe.

Heat insulation

In the event of high temperatures in the silo:

Insulate the external silo wall to avoid exceeding the permitted temperature of the Solicap M housing.

Heat insulation also prevents condensation from forming near the threaded boss in the silo. This reduces buildup and the risk of error switching.

Correct installation

- a. For maximum point level detection, a short threaded coupling is used.
- b. For minimum point level detection, a short threaded coupling is used.
- c. In the event of light buildup on the silo wall, the threaded coupling is welded internally. The probe tip points slightly downwards so that bulk solids slide off more easily.

Incorrect installation

- d. The threaded coupling is too long. This may cause material to settle inside and result in error switching.
- e. Horizontal mounting means a risk of error switching in the event of heavy buildup on the silo wall.

In this case, the Solicap M FTI55 (rod probe) with inactive length is recommended.

f. In areas where product buildup occurs, the device cannot detect if the silo is "empty". In this case, the FTI56 (rope probe) should be installed from above.

In this example, the grounded steel plate forms the counter electrode.

Heat insulation prevents condensation and therefore buildup on the steel plate.

In a silo with concrete walls

When installing in a silo made of plastic, a sheet metal plate must be attached to the exterior of the silo as a counter electrode.

This plate can be either square or round.

- Dimensions in the case of a thin silo wall with a low dielectric constant: approx. 0.5 m along each side or ø0.5 m;
- Dimensions in the case of a thicker silo wall or wall with a higher dielectric constant: approx. 0.7 m along each side or ø0.7 m.

In a silo with plastic walls

Probe length and minimum coverage

Note!

- When selecting the probe length, pay attention to the dependency between the relative dielectric constant ε_r and the minimum amount the probe rod needs to be covered (see Table).
- For probe length tolerances see $\rightarrow \ge 26$.
- To ensure problem-free operation, it is important that the difference in capacitance between the covered and uncovered parts of the probe is at least 5 pF.
- If you do not know the dielectric constant of the material, contact us for advice.

Product properties, relative dielectric constant $\boldsymbol{\epsilon}_r$	
	TI418F12
	* Minimum coverage
Electrically conductive	25 mm
Nonconductive	
_{er} > 10	100 mm
_{er} > 5 to 10	200 mm
$_{er} > 2$ to 5	500 mm

In a silo with metal walls Distance D between the probe and the wall approx. 10 to 25 % of the silo diameter

Correct installation

- a. Solicap M FTI55, FTI56 with inactive length in the event of condensation and material buildup on the silo roof.
- b. At the correct distance from the silo wall, the material inlet and the material outlet. Close to the wall, for reliable switching in the case of a low dielectric constant (not for pneumatic filling). For pneumatic filling, the distance from the probe to the wall should not be too short, as the probe may swing.

Incorrect installation

- c. If too close to the material inlet, inflowing bulk solids may damage the sensor. If close to the center of the material outflow, high tensile forces at this point may cause the probe to break off or subject the silo roof to excessive strain.
- d. The threaded coupling is too long. This may cause condensation and dust to settle inside which may result in error switching.
- e. If too close to the silo wall, the probe may swing slightly against the wall or come in contact with buildup. This can result in error switching.

Silo roof

Ensure that the silo roof is of a sufficiently stable construction. High tensile forces may occur when material is being extracted, particularly in the case of heavy and powdery bulk solids which have a tendency to form buildup.

Coarse-grained bulk solids

In silos with extremely coarse-grained or extremely abrasive bulk solids, the use of a Solicap M $\,$ FTI55 or FTI56 is recommended only for maximum detection.

Distance between the rope probes

To rule out mutual probe interference, you must maintain a minimum distance of 0.5 m between the rope probes. This also applies if you are installing several Solicap M units in adjacent silos with nonconductive walls.

In the event of condensation:

Use the Solicap M with inactive length.

The inactive length (\mathbf{A}) prevents moisture and buildup forming between the active part of the probe and the silo roof.

Or:

To reduce the effects of condensation (\mathbf{B}) and buildup, the threaded coupling (length: max. 25 mm) must project into the silo.

Heat insulation reduces condensation and therefore buildup on the steel plate.

А

B

Silo with walls that conduct electricity

Silo with concrete walls

Installation in the event of buildup

If buildup on the probe rod can be expected when operating the measuring system, the active buildup compensation function prevents the measurement result from becoming distorted. No cleaning work has to be performed on the probe rod.

Installation in plastic tanks

When installing in a silo made of plastic, a counter electrode must be mounted on the silo exterior at the same height as the tensioning weight. The length of the edge of the counter electrode should be approximately the same length as the distance between the tensioning weight and the silo wall.

In a silo with plastic walls

Range of sensor lengths

Electrically conductive bulk solids (e.g. coal) Bulk solids with high dielectric constant (e.g. rock salt)

Bulk solids with low dielectric constant (e.g. dried grain)

* L_B (covered length):

For nonconductive bulk solids with a low dielectric constant, the rope probe must be approx. 5 % (but no less than 250 mm) longer than the distance between the tank roof and the required point level.

Shortening the probe

Rod probe:

The partially insulated version can be shortened at a later stage by the user.

Rope probe:

Both versions (partially and fully insulated) may be shortened at a later stage.

Probe with separate housing

Note!

- For information on how to order, see also "Ordering information" from $\rightarrow \ge 44$ under "Probe design".
- The maximum connection length between the probe and the separate housing is 6 m (L4). When ordering a Solicap M with a separate housing, the desired length must be specified.
- If the connecting cable is to be shortened or passed through a wall, it must be separated from the process connection. See also $\rightarrow \ge 16$ (extension heights).
- The cable has a bending radius of $r \ge 100 \text{ mm}$. This must be observed as a minimum.

Rod length L1 max. 4 m Rope length L1 max. 19.7 m (the maximum total length of L1 + L4 should not exceed 20 m.)

Extension heights

		Polyester housing F16	Stainless steel housing F15	Aluminum housing F17
В	-	76	64	65
H1	-	172	166	177
D	50	-	-	-
H4	62	-	-	-

(D)

Note!

- Connecting cable: ø10.5 mm
- Outer jacket: silicone, notch-resistant

Wall holder unit

Note!

- The wall holder unit is part of the scope of supply.
- The wall holder unit has to be screwed to the separate housing before you can use it as a drilling template. The distance between the holes is reduced by screwing it to the separate housing.

Temperature-derating separate housing

T_a: ambient temperature

 T_{P} : process temperature

* temperature at separate housing ≤ 70 °C

Note!

The maximum connection length between the probe and the separate housing is 6 m (L4). When ordering a device with a separate housing, the desired length must be specified.

If the connecting cable is to be shortened or passed through a wall, it must be separated from the process connection. See "Documentation" => "Operating Instructions" on $\rightarrow \textcircled{} 49$.

Galvanic isolation	FEI51, FEI52 between rod probe and power supply				
	FEI54: between rod probe, power supply and load				
	FEI53, FEI55, FEI57S, FEI58 see connected switching device (functional galvanic isolation in the electronic insert)				
Switch behavior	Binary or Δs operation (pump control, not with FEI58)				
Switch-on behavior	When the power supply is switched on, the switching status of the outputs corresponds to the signal on alarm. The correct switch condition is reached after max. 3 seconds.				
Fail-safe mode	Minimum/maximum quiescent current safety can be switched at the electronic insert (for FEI53 and FEI57S only at Nivotester FTCxxx)				
	MAX = minimum safety: The output switches safety-oriented when the probe is uncovered (signal on alarm). For use for dry running protection and pump protection for example				
	MAX = maximum safety: The output switches safety-oriented when the probe is covered (signal on alarm). For use with overfill protection for example				
Switching delay	FEI51, FEI52, FEI54, FEI55 Can be adjusted incrementally at the electronic insert: 0.3 to 10 s				
	FEI53, FEI57S Depends on the connected Nivotester (transmitter): FTC325, FTC625, FTC470Z or FTC471Z				
	FEI58 Can be adjusted alternately at the electronic insert: 1 s $/$ 5 s				

Electronic insert FEI51 (AC 2-wire)

Connect in series with an external load.

Power supply	Supply voltage: 19 to 253 V AC Power consumption: < 1.5 W Residual current consumption: < 3.8 mA Short-circuit protection FEI51 overvoltage protection: overvoltage category II
Electrical connection	 Always connect in series with a load! Check the following: the residual current consumption in blocked state. that for low voltage: the voltage drop across the load is such that the minimum terminal voltage at the electronic insert (19 V) when blocked is not undershot. the voltage drop across the electronics when switched through is observed (up to 12 V). that a relay cannot de-energize with holding power below 1 mA. If this is the case, a resistor should be connected parallel to the relay (RC module available on request). When selecting the relay, pay attention to the holding power / rated power (see below: "Connectable load").

BA300	Fen0	1	

L00-FMI5xxxx-06-05-xx-en-071

Output signal	Output signal on power failure or in the event of damage to the sensor: < 3.8 mA		
Connectable load	 For relays with a minimum holding power or rated power > 2.5 VA at 253 V AC (10 mA) or > 0.5 VA at 24 V AC (20 mA) 		
	 Relays with a lower holding power or rated power can be operated by means of an RC module connected in parallel. 		
	 For relays with a maximum holding power or rated power < 89 VA at 253 V AC or < 8.4 VA at 24 V AC Voltage drop across FEI51 max. 12 V 		
	Residual current with blocked thyristor max. 3.8 mA		
	Load switched directly into the power supply circuit via the thyristor.		

Signal on alarm

FEI52 electronic insert (DC PNP)

Supply voltage: 10 to 55 V DC
Ripple: max. 1.7 V, 0400 Hz
Current consumption: < 20 mA
Power consumption without load: max. 0.9 W
Power consumption with full load (350 mA): 1.6 W
Reverse polarity protection: yes
Separation voltage: 3.7 kV
FEI52 overvoltage protection: overvoltage category II

Electrical connection

Power supply

Three-wire DC connection

Preferably in conjunction with programmable logic controllers (PLC),

DI modules in accordance with EN 61131-2.

Positive signal present at the switch output of the electronic system (PNP).

CE approval	The devices are designed to meet state-of-the-art safety requirements, have been tested and left the factory in a condition in which they are safe to operate. The devices comply with the applicable standards and regulations that are listed in the EC Declaration of Conformity and thus meet the legal requirements of the EC Directives. Endress+Hauser confirms the conformity and successful testing of the device by affixing the CE mark.
Additional certification	 See also "Ordering information" → ¹/₂ 44 AD2000 The wetted material (316L) corresponds to AD2000 – W0/W2
Other standards and guidelines	EN 60529 Degrees of protection by housing (IP code) EN 61010
	Protection measures for electrical equipment for measurement, control, regulation and laboratory procedures EN 61326 Interference emission (Class B equipment), interference immunity (Appendix A – Industrial).

Weather protection cover	For F13 and F17 housing Order number: 71040497
Overvoltage protection HAW56x	Overvoltage protection (housing) HAW569–A11A (non-hazardous) HAW569–B11A (hazardous area)
	Note! These two versions can be screwed directly into the housing (M20x1.5). Surge arrester for limiting overvoltage in signal lines and components.
	US-Ableiter/Arrester ENDRESS+HAUSER HAW569 HAW569-A1 Uc 34.8 V In 10 kA IL 500 mA

Accessories

Overvoltage protection (cabinet)

HAW562Z (hazardous area)

The HAW562Z module can be used if installing in cabinets.
